

Introduction		SQL Tables	SQL Clauses	SQL Miscellaneous
What is SQL? SQL stands for Structured Query Language. It is a programming language used to store and manipulate the data in relational databases.		CREATE TABLE : It is used to create a new table in a database. CREATE TABLE table_name (column1 datatype, column2 datatype, column3 datatype);	WHERE : It is used to retrieve or update or delete the records based on some condition. This clause can be used with SELECT, UPDATE and DELETE statements. /* SELECT With WHERE */ SELECT column1, column2 ... FROM table_name WHERE condition; /* UPDATE With WHERE */ UPDATE table_name SET column1 = value1, column2 = value2 ... WHERE condition; /* DELETE With WHERE */ DELETE FROM table_name WHERE condition;	AND, OR And NOT : WHERE clause can be used with AND, OR and NOT operators to filter the records with more than one condition. /* AND */ SELECT column1, column2 ... FROM table_name WHERE condition1 AND condition2 AND condition3 ...; /* OR */ SELECT column1, column2 ... FROM table_name WHERE condition1 OR condition2 OR condition3 ...; /* NOT */ SELECT column1, column2 ... FROM table_name WHERE NOT condition;
SQL Database		INSERT INTO : It is used to insert new records into a table. INSERT INTO table_name (column1, column2, column3 ...) VALUES (value1, value2, value3 ...); DROP TABLE : It is used to delete an existing table from a database. DROP TABLE table_name; TRUNCATE TABLE : It deletes all the data from a table but not the table itself. TRUNCATE TABLE table_name;	ORDER BY : It is used to sort the records in ascending or descending order. SELECT column1, column2 ... FROM table_name ORDER BY column1, column2 ... ASC DESC;	EXISTS : It is used to test for existence of any records in a sub query. SELECT column_name(s) FROM table_name WHERE EXISTS (SELECT column_name FROM table_name WHERE condition);
CREATE DATABASE : It creates a new SQL database with specified name. CREATE DATABASE database_name; DROP DATABASE : It is used to delete an existing SQL database. DROP DATABASE database_name; BACKUP DATABASE : It is used to create full back up of an existing SQL database. BACKUP DATABASE database_name TO DISK = 'filepath'; BACKUP DATABASE WITH DIFFERENTIAL: It creates differential back up of an existing database. Differential back up backs up only those parts of the database which have been changed since last back up. BACKUP DATABASE database_name TO DISK = 'filepath' WITH DIFFERENTIAL;		ALTER TABLE : It is used to add, delete and modify table columns. /* Add a column to a table */ ALTER TABLE table_name ADD column_name datatype; /* Delete a column from a table */ ALTER TABLE table_name DROP COLUMN column_name; /* Rename a column of a table */ ALTER TABLE table_name RENAME COLUMN old_name to new_name; /* Change the datatype of a column */ ALTER TABLE table_name MODIFY column_name datatype;	GROUP BY : This clause is often used with aggregate functions like SUM(), COUNT(), AVG()... to group the result set by one or two columns. SELECT column_name(s), aggregate_function_name(column_Name) FROM table_name WHERE condition GROUP BY column_name(s);	AS : It is used to give temporary name called aliases to a table or to a column in a table. /* Alias Column */ SELECT column_name AS alias_name FROM table_name; /* Alias Table */ SELECT column_name(s) FROM table_name AS alias_name;
SQL Constraints		UPDATE : It is used to modify or update table records. UPDATE table_name SET column1 = value1, column2 = value2 ... WHERE condition; DELETE : It is used to delete records from a table. /* Delete all the rows from a table */ DELETE FROM table_name; /* Delete the rows with condition */ DELETE FROM table_name WHERE condition;	HAVING : This clause is added to SQL because WHERE can't be used with aggregate functions. SELECT column_name(s), aggregate_function_name(column_Name) FROM table_name WHERE condition GROUP BY column_name(s) HAVING condition;	LIKE : It is used with WHERE clause to search for a specified pattern in a column. SELECT column1, column2 ... FROM table_name WHERE columnN LIKE pattern;
SQL Operators		SQL Joins		IN : It is used along with WHERE to specify multiple values in WHERE condition. SELECT column_name(s) FROM table_name WHERE column_name IN (value1, value2 ...);
Operators	Symbols	SQL joins are used to combine two or more tables based on a common column between them. INNER JOIN : It selects the records which are common in both the tables. SELECT column_name(s) FROM table1 INNER JOIN table2 ON table1.column_name=table2.column_name;		BETWEEN : It used along with WHERE to filter the values within a specified range. SELECT column_name(s) FROM table_name WHERE column_name BETWEEN value1 AND value2;
Arithmetic Operators	Add (+), Subtract (-), Multiply (*), Divide (/), Modulus (%)	LEFT JOIN : It returns all the records from left table and matching records from right table. SELECT column_name(s) FROM table1 LEFT JOIN table2 ON table1.column_name = table2.column_name;		IS NULL And IS NOT NULL : These are used to test for null values. /* IS NULL */ SELECT column_names FROM table_name WHERE column_name IS NULL;
Bitwise Operators	Bitwise AND (&), Bitwise OR (), Bitwise exclusive OR (^)	RIGHT JOIN : It returns all the records from right table and matching records from left table. SELECT column_name(s) FROM table1 RIGHT JOIN table2 ON table1.column_name = table2.column_name;		/* IS NOT NULL */ SELECT column_names FROM table_name WHERE column_name IS NOT NULL;
Comparison Operators	Equal To (=), Smaller Than (<), Greater Than (>), Smaller than or equal to (<=), Greater than or equal to (>=), Not equal to (<>)	OUTER JOIN or FULL OUTER JOIN : It returns all the records from both the tables. SELECT column_name(s) FROM table1 FULL OUTER JOIN table2 ON table1.column_name = table2.column_name;		
Compound Operators	Add equals (+=), Subtract equals (-=), Multiply Equals (*=), Divide Equals (/=), Modulus Equals (%=), Bitwise AND equals (&=), Bitwise OR Equals (!*=), Bitwise exclusive OR equals (^-=)	SELECT DISTINCT : It selects only distinct values from a table. SELECT DISTINCT column1, column2 ... FROM table_name;		
Logical Operators	AND, OR, NOT, ALL, ANY, BETWEEN, IN, EXISTS, LIKE, SOME	SQL Functions		SQL Indexes
SQL Comments		COUNT() : It returns the number of rows which satisfy the given condition. SELECT COUNT(column_name) FROM table_name WHERE condition; AVG() : It returns average value of a numeric column. SELECT AVG(column_name) FROM table_name WHERE condition;	SQL stored procedure is a group of pre-compiled SQL statements forming one logical unit and they are stored in a database server and can be called whenever required without compiling again and again. CREATE PROCEDURE : This statement is used to create stored procedures. CREATE PROCEDURE procedure_name @parameter_name data_type AS BEGIN -- SQL statements END	
--Single Line Comment		SUM() : It returns sum of a numeric column. SELECT SUM(column_name) FROM table_name WHERE condition;	SQL Stored Procedures	
/* Multi Line Comments */		MIN() : It returns minimum of a specified column. SELECT MIN(column_name) FROM table_name WHERE condition;	SQL stored procedure is a group of pre-compiled SQL statements forming one logical unit and they are stored in a database server and can be called whenever required without compiling again and again. CREATE PROCEDURE : This statement is used to create stored procedures. CREATE PROCEDURE procedure_name @parameter_name data_type AS BEGIN -- SQL statements END	
SQL Views		MAX() : It returns maximum of a specified column. SELECT MAX(column_name) FROM table_name WHERE condition;	EXEC : It is used to call stored procedures. EXEC procedure_name;	
SQL views are nothing but the virtual tables based on a result set returned by a SQL statement. CREATE VIEW : It is used to create view. CREATE VIEW view_name AS SELECT column1, column2 ... FROM table_name WHERE condition;		ROUND() : It is used to round a numeric field. SELECT ROUND(column_name, decimals) FROM table_name;	ALTER INDEX RENAME TO : It is used to rename already existing index. ALTER INDEX old_index_name RENAME TO new_index_name;	
CREATE OR REPLACE VIEW : This statement is used to update an already existing view. CREATE OR REPLACE VIEW view_name AS SELECT column1, column2 ... FROM table_name WHERE condition;		NOW() : It returns current date and time. SELECT NOW() FROM table_name;	DROP INDEX : It is used to remove an already existing index on a table. DROP INDEX Index_Name;	
DROP VIEW : It is used to remove an already existing view. DROP VIEW view_name;
